

# Tests for Bti application

---

Before running the tests:

In *elasticsearch.rb* comment out the if File.exists? statement (line 10, 11, and 12). (if we run the tests with that if statement we get an deep symbolize key error)

**Don't forget to do that back after the testing!**

Run the test:

To run all rspec tests (./bti-usa):

```
rspec
```

To run specific file:

```
rspec spec/features/file_name.rb
```

To run specific test from file:

```
rspec spec/features/file_name.rb:line_number
```

or

```
rspec spec/features/file_name.rb -e 'test name'
```

After adding new tests, run rubocop (Automatic Ruby code style checking tool. Aims to enforce the community-driven Ruby Style Guide.).

First install locally rubocop:

```
gem install rubocop -v 0.50.0
```

Newer versions of rubocop requires newer ruby versions.

In the command line go to the folder:

```
./bti-usa/spec
```

And run:

```
rubocop
```
