Heroku Workflow

You have to be in Git master

Run in terminal:

```
$ heroku login
```

then run code below

```
$ heroku create {name}
```

Change name with name of your application. If you don't choose a name Heroku creates one.

Run

```
$ git push heroku master
```

It takes a while, depends on the size and gems of your application

Then run

```
$ heroku run rake db:migrate
```

This creates and migrates your database

And if you need the seed

```
$ heroku run rake db:seed
```

To drop the database:

```
$ heroku pg:reset DATABASE_URL
```

end then to recreate the database with nothing in it:

```
$ heroku run rake db:migrate
```

To fetch your logs, use command:

```
$ heroku logs
```

To see status of Heroku server>

```
$ heroku ps
```

And to restart Heroku server

```
$ heroku restart —a apname
```

and thats it !!
