Real dark theme for slack

Find your Slack's application directory

- Windows: %homepath%\AppData\Local\slack\
- Mac: /Applications/Slack.app/Contents/

open `resources\app.asar.unpacked\src\static\index.js`

For versions after and including 3.0.0 the same code must be added to the following file
`resources\app.asar.unpacked\src\static\ssb-interop.js`

At the very bottom, add

```
// First make sure the wrapper app is loaded
document.addEventListener("DOMContentLoaded", function() {

  // Then get its webviews
  let webviews = document.querySelectorAll(".TeamView webview");

  // Fetch our CSS in parallel ahead of time
  const cssPath =  'https://raw.githubusercontent.com/Nockiro/slack-black-
theme/3ea2efdfb96ccc91549837ab237d57104181bbf8/custom.css';
  let cssPromise = fetch(cssPath).then(response => response.text());

  let customCustomCSS = `
  :root {
     /* Modify these to change your theme colors: */
     --primary: #09F;
     --text: #CCC;
     --background: #080808;
     --background-elevated: #222;
  }
  `

  // Insert a style tag into the wrapper view
  cssPromise.then(css => {
     let s = document.createElement('style');
     s.type = 'text/css';
     s.innerHTML = css + customCustomCSS;
     document.head.appendChild(s);
  });

  // Wait for each webview to load
  webviews.forEach(webview => {
     webview.addEventListener('ipc-message', message => {
        if (message.channel == 'didFinishLoading')
           // Finally add the CSS into the webview
           cssPromise.then(css => {
              let script = `
```

```
                    let s = document.createElement('style');
                    s.type = 'text/css';
                    s.id = 'slack-custom-css';
                    s.innerHTML = \`${css + customCustomCSS}\`;
                    document.head.appendChild(s);
                    `
            webview.executeJavaScript(script);
        })
    });
  });
});
```

Save, restart Slack and done.
